

I recently completed an assignment to create a website for restaurant. The website was designed to be informative.

To achieve that, Firstly I visited many of restaurant websites and to know their way of designing webpages. Then I opened the Assignment pdf and trying to design website according to given tasks.

On coding part I start creating index file in which I added a background image from unsplash(website), and then make a div add background in it, the challenge part is to align the div section as given task and manage their buttons accordingly. W3school website and webdev websites helps me to complete that task. While creating it I learnt many of new things to design in css.

After completing index/home page I created our menu page and link with the home page to redirect it. While making this page I learnt in good way to use of flex and hover effect. And learnt many of the new things like while designing in css we can design with all the child element in by giving the name of their parent element space and the child tag or id name.

After completing menu page I created contact us page which feels me easy to design. There I created a form and give design in css.

At last, I designed About us page by using css. With the help of online websites I put content in it.

While creating this website(completing assignment ) I learnt the proper way of designing the website by using css. Many additional things I learnt apart from the course.

This assignment help me to learn how to design the website in attractive way. Challenges gives me the chance to learn new things.
